

# DEA100 INORGANIC CERAMIC MEMBRANE ELEMENT

#### Performance Characteristics

The ceramic membrane is a high-tech technology in the field of nano-scale separation, featuring good corrosion resistance and high temperature resistance. The filtration form is "cross-flow" filtration. Under the pressure-driven, the raw material liquid flows through the membrane tube, the small molecular components pass through the membrane, while the macromolecular components are intercepted by the membrane, thereby realizing low-temperature separation, concentration and purification of the nano-scale substances in the fluid.

Delemil ceramic membranes cover three levels of micro-filtration, ultra-filtration and nano-filtration. The length can be customized in the range of 100~1,200mm.

### Membrane Specifications

#### Parameters of Membrane Element

| Model  | Outer Diameter | Channel Number | Standard Length | Membrane Area |
|--------|----------------|----------------|-----------------|---------------|
|        | (mm)           | (n)            | (mm)            | (m²)          |
| DEA100 | 41             | 19             | 1060            | 0.379         |

## **Schematic Diagram and Dimensions**

| Category  | Aperture<br>(nm) | MWCO<br>(Da) | Operating<br>Temperature | Operating<br>PH |  |  |  |
|---|------------------|--------------|--------------------------|-----------------|--|--|--|
| Ceramic Microfiltration<br>Membrane             | 70-800           |              | -10-150℃                 | 0-14            |  |  |  |
| Ceramic Ultrafiltration<br>Membrane             | 3-30nm           | 2000-100000  | -10-150℃                 | 0-14            |  |  |  |
| Ceramic Nanofiltration<br>Membrane              | 0.9-1nm          | 200-750      | -10-150℃                 | 0-14            |  |  |  |
| Length: It can be customized within 100-1200mm. |                  |              |                          |                 |  |  |  |
